Background and Architecture

Cluster Architecture

► Import nodes from old system into Ironic

- ▶ Import nodes from old system into Ironic
- ► Create neutron port for the node

- ► Import nodes from old system into Ironic
- Create neutron port for the node
- ► If the node is already active in the old system, 'fake' boot it with fake_pxe driver

- ▶ Import nodes from old system into Ironic
- Create neutron port for the node
- ▶ If the node is already active in the old system, 'fake' boot it with fake_pxe driver
- Once everything is successful, switch to pxe_ipmitool driver

Ironic

Ironic Setup

► Ironic API runs behind Apache Server

Ironic Setup

- ► Ironic API runs behind Apache Server
- ► Ironic Conductors(2)

What could possibly go wrong?

What could possibly go wrong?

► Boots started to fail

What could possibly go wrong?

- ► Boots started to fail
- ► Ironic API calls took too long

Solutions

Sync_Power_State periodic task

Solutions

- Sync_Power_State periodic task
- ► Increase the number of Ironic Conductors

Solutions

- Sync_Power_State periodic task
- ► Increase the number of Ironic Conductors
- Run multiple conductors on the same host

Neutron

► All 3 API servers run neutron-server

- ► All 3 API servers run neutron-server
- ▶ 24 API/RPC workers

- ► All 3 API servers run neutron-server
- ▶ 24 API/RPC workers
- ► 4 neutron dhcp agents

- ► All 3 API servers run neutron-server
- ▶ 24 API/RPC workers
- ▶ 4 neutron dhcp agents
- ► All networks/subnets are managed by all 4 agents (HA)

- ► All 3 API servers run neutron-server
- ▶ 24 API/RPC workers
- ▶ 4 neutron dhcp agents
- ► All networks/subnets are managed by all 4 agents (HA)
- ► ISC DHCPD driver instead of dnsmasq

What is sync state?

A tale of two drivers

► OMShell driver

A tale of two drivers

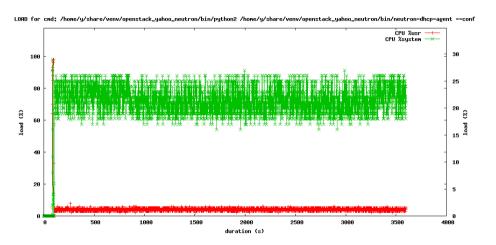

- ► OMShell driver
- ► Pypureomapi driver

OMShell

>remove

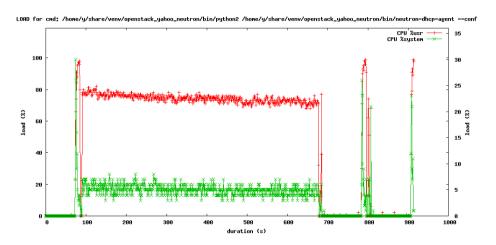

```
-bash-4.1$ omshell
> server 127.0.0.1
> port 7911
> key keyname secret
> connect
obj: <null>
> new host
obj: host
> set hardware-address = 00:1c:1a:1d:10:54
obj: host
hardware-address = 00:1c:1a:1d:10:54
> open
obi: host
hardware-address = 00:1c:1a:1d:10:54
ip-address = 0a:d7:a6:b1
name = "hostname.yahoo.com-0"
hardware-type = 00:00:00:01
```

Sync State with OMShell

Sync State with PypureOMAPI

Where do we go from here?

► ISC DHCPD restarts are not ideal

Where do we go from here?

- ► ISC DHCPD restarts are not ideal
- ► VIP thinks dhcpd is down whenever it restarts

Where do we go from here?

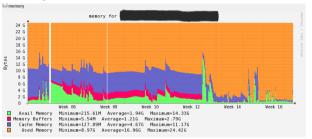

- ISC DHCPD restarts are not ideal
- ▶ VIP thinks dhcpd is down whenever it restarts
- ► Move to Kea DHCP Server if possible

Density Test

When did things started to break?

► At 24500 nodes, API servers started swapping

Swap and memory usage on API nodes

► Neutron the biggest user of memory: 1.4 GB per process

- ▶ Neutron the biggest user of memory: 1.4 GB per process
- ► Subnets: 2500, Ports: 43000

- ▶ Neutron the biggest user of memory: 1.4 GB per process
- ► Subnets: 2500, Ports: 43000
- ► Easy fix: Reduce number of api_workers and rpc_workers

- Neutron the biggest user of memory: 1.4 GB per process
- ► Subnets: 2500, Ports: 43000
- ► Easy fix: Reduce number of api_workers and rpc_workers
- ► Long Term Fix: Investigate memory usage, isolate neutron

► Do a *density* and *scale* testing before taking on production

- ▶ Do a *density* and *scale* testing before taking on production
- Avoid spawning processes, try and use native python libraries whenever possible

- ▶ Do a *density* and *scale* testing before taking on production
- Avoid spawning processes, try and use native python libraries whenever possible
- ▶ Pay attention to periodic tasks

- ▶ Do a *density* and *scale* testing before taking on production
- Avoid spawning processes, try and use native python libraries whenever possible
- Pay attention to periodic tasks
- ▶ Be prepared to scale horizontally

- Do a *density* and *scale* testing before taking on production
- Avoid spawning processes, try and use native python libraries whenever possible
- Pay attention to periodic tasks
- ▶ Be prepared to scale horizontally
- Pay attention to number of workers,conductors,rpc_workers

- Do a *density* and *scale* testing before taking on production
- Avoid spawning processes, try and use native python libraries whenever possible
- Pay attention to periodic tasks
- Be prepared to scale horizontally
- Pay attention to number of workers,conductors,rpc_workers
- Don't forget to have fun :)
